## Circle Section: L1 Online

Write answers in appropriate blanks. When no blanks are provided CIRCLE your answers. SHOW WORK when requested.

No notes or books are allowed. Calculators (except for ones connected to the internet) are allowed. Do not use your own scrap paper. If you need some, ask me.

Rounding Instructions: Please round all answers to 2 decimal places unless otherwise stated.

## Make sure you have all 4 pages ( 8 problems).

DO NOT WRITE BELOW THIS LINE
The numbers written in each blank below indicate how many points you missed on each page. The numbers printed to the right of each blank indicate how many points each page is worth.

Page 1 $\qquad$ 10

Page 2 35

Page 3 $\qquad$ 30

Page 4 25

## Score

$\qquad$
Scores will be posted on Compass Wed night and exams will be returned in class on Thursday. Online student can pick up their exams during office hours between $4-6 \mathrm{pm}$ in 23 IH .

Question 1 (2 pts)
Suppose you'd like to do linear regression but your scatter plot is not close to linear. You see that the histogram of the Y variable is right skewed and you'd like to transform it to be more normal. Which transformation(s) would be possible candidates?
Circle all that could be. i) $\mathrm{Y}^{2}$
ii) $\mathrm{Y}^{3}$
iii) $e^{Y}$
iv) $\sqrt{\mathrm{Y}}$
v) $\ln (\mathrm{Y})$

Question 2 (8 pts.) pertains to the Area (in square miles) and the population of 77 US cities.

Scatter plot of Area vs Population

Histograms of Area (top) and Population (bottom)

a) (2 pts.) Below are histograms of the transformed Area. Which of the 5 transformations do the histograms depict? Below each histogram circle the transformation the histogram represents.

Below is the scatter plot of $\ln$ (Area) vs $\ln$ (Population) on the left and the residual plot on the right.

b) $\left(2\right.$ pts.) The regression Equation is: $\ln ($ Area $)=\mathbf{- 3 . 3 + 0 . 6 2} * \ln ($ Population $)$ and $\mathbf{S D}_{\text {errors }}=0.75$

Use the regression equation above to predict the $\ln$ (Area) and Area of a city with a population of 3,000,000.
Round final answers to 2 decimal places. You may use your rounded answer for $\ln ($ Area) to compute Area.

$$
\ln (\text { Area })=
$$

$\qquad$ Area $=$ $\qquad$ sq miles
c) (2 pts.) Build a $\mathbf{9 5 \%}$ Confidence Interval for your estimate of Area in part (c). Your answer should be a confidence interval for Area (NOT $\ln ($ Area)). Show work. Circle answer. Round to 2 decimal places. (Use $\mathrm{Z}=2$ as the critical value for $95 \%$ )
$\qquad$ sq miles to $\qquad$ sq miles)
d) (2 pts.)A certain \% Confidence Interval for the area of another city was computed to be ( 90 sq miles to 403 sq miles), but we don't know the $\%$ CI. If possible calculate the estimated area of the city and show work. If not, write not enough info.

Question 3 (10 pts.)
For each of the following is it appropriate to use logistic regression? Circle Yes or No.
i) Predicting eye color from hair color. YES NO
ii) Predicting year in school from age. YES NO
iii) Predicting passing the final from class attendance. YES NO
iv) Predicting passing the final from gender. YES NO
v) Predicting $\ln$ (Childrens Income) from $\ln$ (Parents Income). YES NO

Question 4 (15 pts.)
For the following problems p is defined as the probability of "success" and 1-p is the probability of "failure".
Fill out the 15 missing blanks in the table below.

Question 5 (6 pts.)
a) Which plot violates linearity? Circle one: A B C
b) Which plot is linear but violates equal variability of the errors around the regression line? Circle one: A B C
c) Which plot is well suited to linear regression analysis as is? Circle one: A $\quad$ B $\quad$ C

Question 6 (4 pts.) True or False?
i) The logistic regression model only handles $Y$ values that can be coded as 1's and 0 's. Circle one: True False
ii) A $\log$ transformation of any variable turns a linear regression model into a logistic regression model. Circle one: True False

Question 7 ( 30 pts.) Below is the output from the logistic regression model predicting the probability of being Greek (a member of a fraternity or sorority) from gender (Males=0, Females=1) and \# drinks per week, based on the 778 students who answered Survey 2. Let's treat them as if they were a random sample.

| $Y$ | R | n | \# X's | Chi-square |  | df | p-value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| greek | 0.3352 | 778 | 2 | 113.8 |  |  | 0\% |  |
|  |  |  | Slopes |  |  |  | $\square$ |  |
|  |  |  |  |  | SE |  | z | p -values |
| Intercept |  |  | -1.665 |  | 0.1856 |  | -8.974 | 0\% |
| gender |  |  | 0.3956 |  | 0.1804 |  |  | 2.83\% |
| drinks_per_week |  |  | 0.09134 |  | 0.009694 |  | 9.422 | 0\% |

a) (2 pts.) A $\chi^{2}$ test was done for the overall regression and a Z-test for the individual slopes. Could we have used F and t tests instead? Circle one:
i) No ii) Yes, but it's not needed since the sample size is large.
b) (1 pt.) How many df for the $\chi^{2}$ test? $\qquad$
c) (2 pts.) Calculate the Z stat to test: $\mathrm{H}_{0}:$ Slope $_{\text {gender }}=0$. Show work and round answer to 2 decimal places.

$$
\mathrm{Z}=
$$

d) (1 pt.) What's the $\mathbf{l o g}$ (odds) form of the logistic regression equation for the probability of being Greek?
$\ln \left(\frac{\hat{\mathbf{p}}}{1-\hat{\mathbf{p}}}\right)=$ $\qquad$ $+$ $\qquad$ Gender + $\qquad$ Drinks
e) (2 pts.) Are females more or less likely than males to be Greek given the same level of drinking? Circle one:
i) More
ii) Less
iii) Same
iv) Not enough info
f) (4 pts.) Calculate the odds ratio for Gender and Drinks? Show work and round answer to 2 decimal places.
i) Gender $\hat{\mathbf{O} R}=$ $\qquad$ ii) Drinks $\hat{\mathbf{O} R}=$ $\qquad$
g) (6 pts.) Use this rounded equation: $\ln (\mathbf{o d d s})=\mathbf{- 1 . 7}+\mathbf{0 . 4}$ Gender $+\mathbf{0 . 1}$ Drinks to predict the $\ln$ (odds), odds, and probability of being Greek for the individuals in the table below: Show work and Round answers to 2 decimal places.

| Gender: 0 =M 1=F | Drinks | $\mathbf{l n}$ (odds) | Odds | $\mathbf{p}$ |
| :--- | :--- | :--- | :--- | :--- |
| Male | 20 |  |  |  |
| Female |  |  |  | 0.5 |
|  |  |  |  |  |

h) (2 pts.) Two males differ in their number of drinks per week by 5, compare their odds of being in a fraternity (given our logistic model). The heavier drinker has $\qquad$ times greater odds of being Greek.
i) $1.1 \times 5$
ii) $1.1^{5}$
iii) $1.49 \times 5$
iv) $1.49^{5}$
v) Not enough info
i) (2 pts.) Would your answer to (h) above change if you're comparing the odds of 2 females with a 5 drink difference?
i) Yes, it would be bigger
ii) Yes, it would be smaller
iii) No, it would be the same.
j) (2 pts.) Two males differ in their number of drinks per week by 5 , compare their probability of being Greek (given our logistic model). The heavier drinker has $\qquad$ times greater probability of being in a fraternity.
i) same answer as in (h) above
ii) answer in $\mathrm{h} /(1+$ answer in h$)$
iii) Not enough info
k) (2 pts.) Construct a $95 \%$ Confidence Interval for the Gender slope. (Use Gender slope $=0.4$ with $\mathrm{SE}=0.18$ )
a) $0.4+/-0.18$
b) $0.4+/-0.36$
c) $0.4+/-0.95(0.18$
I) (2 pts.) Construct a 95\% Confidence Interval for the Odds Ratio for Gender.
a) $e^{0.4} \pm e^{0.18}$
b) $\mathrm{e}^{0.4} \pm \mathrm{e}^{0.36}$
c) $\mathrm{e}^{0.4} \pm \mathrm{e}^{0.95(0.18)}$
d) $\left(\frac{\mathrm{e}^{0.4}}{\mathrm{e}^{0.36}}\right.$ to $\left.\mathrm{e}^{0.4} \mathrm{e}^{0.36}\right)$
m) (2 pts) Since the $95 \%$ Confidence Interval for the Gender slope did not include 0 , the p -value for a 2 -sided Z test $<$ $\qquad$ \% and the p-value for a 1 -sided test $<$ $\qquad$ \%. Fill in the 2 blanks with numbers.

Question 8 ( 25 pts.)A predictor of 5 year survival rate from breast cancer is the diameter of the tumor. Below is the log odds regression equation predicting the probability of survival after 5years from the diameter of the tumor measured in cm from a hypothetical study of a 100 patients.

$$
\ln \left(\frac{\hat{\mathbf{p}}}{1-\hat{\mathbf{p}}}\right)=3-0.6 \text { Diameter }
$$

a) (2 pts.)Use the above equation to estimate the $\ln$ (odds) and odds of 5 yr survival for a patient with a tumor of 3 cm .

## Round answers to 2 decimals.

$$
\ln (\text { odds })=
$$

Odds= $\qquad$
b) (2 pts.) What is the probability of 5 yr survival for a patient with a tumor of 3 cm .

Round answer to 2 decimals.
Probability is $\qquad$ \%
c) (2 pts.) How does the estimated probability of surviving 5 years change if the tumor increases in diameter by 1 cm ? Circle one:
i) It changes by a fixed additive amount regardless of the tumor size. (i.e., there's a constant slope in the probability vs. size plot)
ii) It changes by the fixed multiplicative factor, $\mathrm{e}^{-0.6}$
iii) Neither of the above, you can't describe how the probability changes with either an additive or multiplicative constant since probability is bounded between 0 and 1 .
d) ( 6 pts ) What diameter does the tumor have to have for the estimated probability of 5 -year survival to be $20 \%$ and $80 \%$ ? Answer by filling out the table below. In $(\mathbf{p} /(\mathbf{1 - p}))=3$ - 0.6 Diameter. Round answers to 2 decimal places. Show work for $1^{\text {st }}$ column.

| Tumor Diameter in cm | $\ln$ (Odds) | Odds | $\mathbf{P}$ |
| :--- | :--- | :--- | :--- |
|  |  |  | 0.2 |
|  |  |  | 0.8 |

Below are plots depicting the probability, the odds or the $\ln$ (odds) of surviving 5 years based on the breast tumor size. The X axis is diameter of the tumor in cm and the Y axis is either probability, odd or $\ln$ (odds) of survival.

e) (3 pts) Which plot is which? Plot $\qquad$ depicts probability, Plot $\qquad$ depicts odds, and Plot $\qquad$ depicts $\ln$ (odds). Fill in the 3 blanks above with $A, B$, or $C$.
f) (4 pts) The $\ln ($ odds $)$ equation is $\ln (\mathbf{p} /(\mathbf{1 - p}))=\mathbf{3 - 0 . 6} \mathbf{X}$, where $\mathrm{X}=$ diameter of tumor. What are the odds and probability equations?
i) $(2 \mathrm{pts})$ Odds equation: $\mathrm{p} /(1-\mathrm{p})=$ $\qquad$ ii) (2 pts) Probability equation: $\mathrm{p}=$ $\qquad$
g) (2 pts) Judging from the plots what tumor diameter size gives a $50-50$ chance of surviving 5 years? $\qquad$ cm
h) (4 pts) The diameter size that gives a 50-50 chance of surviving has a $y$-value $=$ $\qquad$ in Plot B and a y -value $=$ $\qquad$ in Plot C.
